

ABSTRACT OF THE DISCLOSURE

An outside mirror for a motor vehicle has a mirror foot (1) fastenable to the vehicle and a mirror carrier (3) fastenable to the mirror foot so as to be capable of swivelling about a swivelling axis. The mirror carrier (3) is fastenable to the mirror foot (1) by virtue of the latching of at least one first detent element (11) in a first detent contour (12). In this the position of the mirror carrier (3) relative to the mirror foot (1) at at least one defined swivel angle may be secured by virtue of the latching of at least one second detent element in a second detent contour (15, 16). The mirror carrier (3) in the latched state of the first detent element (11) is displaceable counter to the pressure of a spring element (11) at least far enough in the direction of the swivelling axis for the second detent element to be unlatchable from the second detent contour (15, 16) through swivelling of the mirror carrier (3).
